C · Barcode scanning: scan, found it, not found

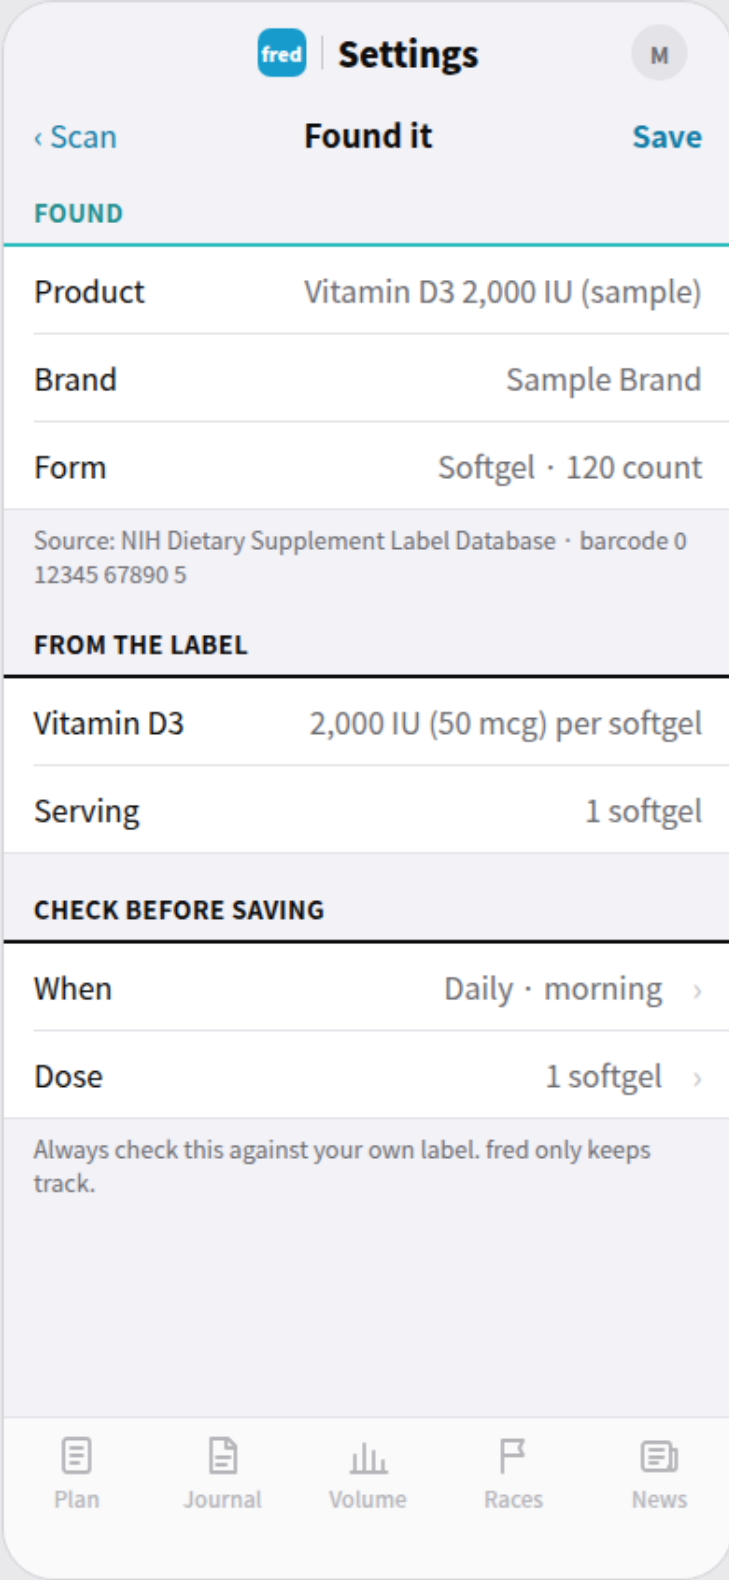

1 · Scan

" + Add " > Scan. The camera finds the barcode (works on iPhone with a free scanner library). "Type it instead" is always there.

2 · Found it

fred looks it up in free public databases and fills in name, form and what's in it, with the source shown. You confirm dose and when.

3 · Not found

Coverage isn't perfect, especially pharmacy bottles. Add it by hand once; fred remembers the barcode for next time.
