NOTES FROM YOUR PLAN

If you want to alter this workout to be power-based or HR-based, it is simple! Simply click on the bar graph of the workout, change the "units" field to "power" or "hr" and then alter the intensity of each step to match the ranges listed in the plan PDF.

Plan it

5 / 8 · fred round · 2026-10-05 v3

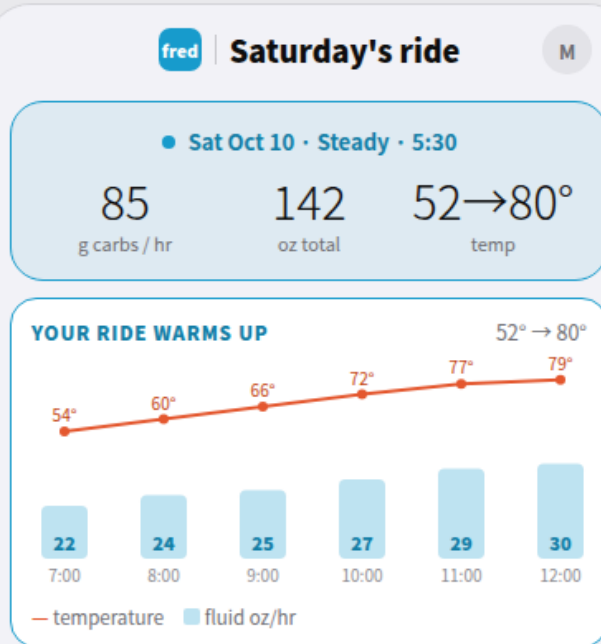

E · Hour-by-hour planning for rides that warm up or cool down (no layer advice)

Results: planned hour by hour

The ride's weather is read for each hour you're out there. Fluid rises from 22 to 30 oz/hr; gels taper as bottles take over.

Why not the average?

Same total, wrong timing.

Hour by Hour

7:00	54°	22 oz	2 gels
8:00	60°	24 oz	1 gel
9:00	66°	25 oz	1 gel
10:00	72°	27 oz	1 gel
11:00	77°	29 oz	1 gel
12:00	79°	30 oz	no gel

Carbs stay at 85 g/hr every hour. Bottles stay the same strength; as you drink more in the heat, they carry more of the carbs and you need fewer gels (whole gels only).

Average vs hour by hour (sample)

	Average 66°	Hour by hour
7-8 AM	25 oz	22 oz
Noon	25 oz	30 oz
Whole ride	140 oz	142 oz

The total comes out about the same. What the average gets wrong is **when**: too much early when it's cool, too little at noon when you need it most. Sodium follows the fluid, so it shifts the same way.

F · Fluid limits editor fix

Tap "Lowest"

One "Fluid limits" sheet with both values; the one you tapped is highlighted and ready to change.

fred

Settings

+

fred never plans more than this, even in the heat.

Your sweat grid runs 14–38 oz/hr. Limits apply after it.

They can't cross

If highest gets too close to lowest, fred says so and nudges the number; it never saves a highest below the lowest.

fred
